

# CISCO VPN Client 4.6.x Installation Guide

Ensure all software (especially all client software such as instant messaging programs, filesharing programs such as limewire etc) are not running before you attempt to install the VPN client. If you have a previous version of the Cisco VPN client it must be uninstalled before the new client can be installed. If you do not do this manually it will be done for you when you run the setup program but will require that you reboot your system.

Browse the CD contents and launch the file **vpnclient\_setup.exe** by double clicking it. The Windows Installer will begin to guide you through the installation process.

click **Next**

**Accept the License Agreement** and click **Next**

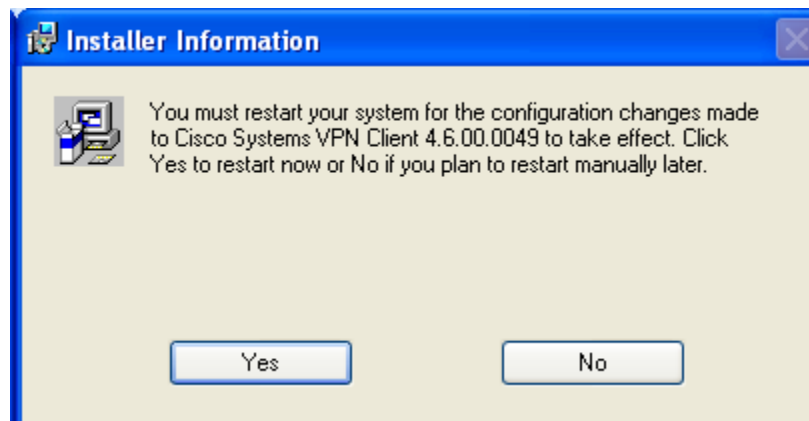

Choose the installation directory.

**PLEASE NOTE:** It has been noticed that in this version of the Cisco VPN client the install process may appear to hang – the install progress bar/estimate is grossly optimistic about the time left in the installation. Please give it an additional 3-5 minutes.

Software will install until you reach the following prompt:

click **Finish**

You must now restart your computer to complete the VPN installation.
